

FAFO Index — India's Real-Time Internet Relevance & Reaction Platform

FAFO Index is a public leaderboard that tracks who is rising or falling in India's online culture, using a combination of automated relevance data and human sentiment voting.

Instead of relying on followers, PR coverage, or media narratives, FAFO Index measures two things separately:

1. Who is being talked about the most right now
2. How people feel about them

Together, these create a live picture of cultural momentum. Automated Relevance Engine — Who Is Trending

FAFO Index continuously scans major public internet sources to detect unusual spikes in attention around individuals, including:

- Search trends
- Social and community discussions
- News and video platforms

How it Works:

When a person's name shows a sudden increase in mentions and activity compared to their normal baseline, they automatically enter the Relevance Chart.

This allows:

- Viral personalities to appear without manual addition
- Sudden controversies or breakthroughs to be reflected instantly
- Rankings to respond to real internet behavior, not editorial choices

Relevance is based on attention volume and speed of spread, not likes or followers, which are easily manipulated.

Chart Question: "Who is the internet talking about today?"

The 24-Hour Rule:

If someone enters the Relevance Chart but receives no votes within 24 hours, they are automatically removed from both the Relevance and Sentiment charts. If they are still trending the next day, they are added again automatically. This keeps charts focused on figures that people actually care enough to react to, not just briefly mentioned names. Public Sentiment Layer — How People React

Once a person appears on the Relevance Chart, users can rate them on a scale from -10 to +10 based on recent actions, statements, performances, or controversies.

- Positive moments push scores upward
- Backlash or public disappointment pulls scores down

Unlike daily reset systems, scores accumulate over time, reflecting long-term reputation along with short-term spikes.

To keep competition meaningful as scores grow, individuals move through league tiers after crossing certain thresholds, creating ongoing ranking battles at every level.

Chart Question: “Are people supporting them or turning against them?” India-First with State-Level Filters

FAFO Index launches in India, where online culture, celebrity fandom, political debate, and meme cycles move extremely fast.

Users can filter charts by:

- National rankings
- Individual states

This allows visibility into:

- Regional political figures
- Local viral personalities
- State-specific controversies and fame cycles

A creator or politician can be dominating conversation in one state while being irrelevant nationally, and the platform reflects that difference instead of flattening everything into one national score. Who Appears on FAFO Index

Only individuals who are already part of public discourse are listed, including:

- Celebrities
- Politicians
- Digital creators
- Business figures who trend
- Viral personalities

Private individuals cannot be rated. The platform tracks culture, not personal disputes. Why People Use It

People already:

- Track drama
- Argue over fame
- Fight fan wars
- Celebrate rises and mock falls

FAFO Index turns scattered reactions into visible competition.

Instead of asking: “Is this person finished?” People can see: their relevance curve, league movement, and sentiment trend.

It transforms passive scrolling into participation. What FAFO Index Is — and Is Not

FAFO Index is:

- A cultural momentum tracker
- A public reaction scoreboard
- A gamified mirror of internet behavior

It is not:

- A scientific popularity ranking
- A moral judgment system
- A private-person rating app

It reflects attention and reaction, not truth or virtue. Core Philosophy

In the internet age, reputation is not stable — it is volatile, emotional, and crowd-driven.

FAFO Index doesn't try to clean that up. It visualizes it.

People step into the public arena. The internet responds. The numbers move.

That feedback loop already exists. FAFO Index just makes it visible.

That 24-hour no-vote drop rule is doing three important jobs quietly:

- removes noise
- forces engagement
- prevents charts from becoming stale

It's exactly the kind of mechanic that separates a live system from a static ranking site. Early Stage Operation & Engagement Design

At launch, FAFO Index will rely primarily on trending data from social media and public platforms, since meaningful voting volume will not exist until a user base is established.

People listed in charts will be clickable. Opening a profile will show:

- their relevance history
- how their sentiment has changed over time
- and a short explanation of why they are trending at that moment

This turns charts into stories instead of just numbers and keeps users exploring instead of bouncing.

Users will also be able to comment under charts and individual profiles. These comments will be automatically deleted after one week, keeping discussion focused on current events rather than permanent flame wars.

The target audience is Gen Z and upcoming digital-native generations, so the UI and interaction design will be built around fast feedback, visual movement, and social-style engagement.

The platform remains open to new mechanics, add-ons, and community-driven features as usage patterns emerge, allowing FAFO Index to evolve with how people actually behave on it rather than being locked into fixed assumptions.
